

Deterministici

- WW (dom. variabile)
- EPQ / EOQ (dom. costante)
(MODELLO STATICO)
G PER DOMANDA STAZIONARIA

variabilità domanda

Stocastici

- NEWS VENDOR

POLITICHE DI RIORDINO DINAMICHE

→ var. domanda

→ var. LT

⇒ SCORTE DI SICUREZZA

Politiche riordino per domanda non stazionaria

Revisione continua

$$R_{op} = \hat{D} \cdot LT + SS$$

previsione domanda a periodo

safety stock

Revisione periodica ogni T periodi

$$S = \hat{D} \cdot (LT + T) + SS$$

Nei modelli di inventario per domanda non stazionaria in media e variante, R_{op} e S vengono aggiornati prima di ogni ordine

Scorte di sicurezza

$N(\mu, \sigma)$

Cycle Service Level
- CSL: probabilità di un ordine in rottura di stock durante l'aggiornamento

$Rop(S)$ deve garantire un certo CSL

$$CSL = \Pr \{ D_{LT} \leq Rop \}$$

$F(Rop)$ = Dist. cumulata di D_{LT} calcolata in Rop
 $\downarrow$
 $= \Pr \{ D_{LT} \leq Rop \} = CSL$

$$CSL = F(Rop)$$

rev. continua

cumulata D_{LT}

$$CSL = F(S)$$

rev. periodica

cumulata D_{T+LT}

$$Rop = F^{-1}(CSL)$$

$$S = F^{-1}(CSL)$$

$\hat{D}_{LT}$

VERE PER OGNI ddp DELLA DOMANDA

$$Rop = \hat{D} \cdot LT + SS$$

$$I_{\text{cop}} = D \cdot L1 + 2S$$

$$S = \underbrace{\hat{D} \cdot (LT+T)}_{\hat{D}_{LT+T}} + SS$$

→ VENE PER DOMANDA NORMALE

$$\begin{aligned}
 R_{op,t} &= \hat{D}_t \cdot LT + \text{SS} \\
 &= \hat{D}_t \cdot LT + K \sigma_{LT,t}
 \end{aligned}$$

$$K = \text{safety factor} = \text{INV.NORM.S} (CSL)$$

$\text{NORM.S} (0, 1)$

$\left[\begin{matrix} T \\ a \\ b \\ \vdots \\ a \\ b \\ \vdots \end{matrix} \right]$

$$S_t = \hat{D}_t \cdot (LT + T) + K \cdot \sigma_{LT+T,t}$$
